Webhook System Manual

A webhook system for delivering reservation messages offers a streamlined way to receive real-time updates about your business. By leveraging webhooks, which function as HTTP callbacks or endpoints, this system enables dynamic interaction between applications. This guide explains how to set up and effectively utilize the webhook system.

Integration Setup

1. **Endpoint Configuration:** Your system must include a webhook receiver to receive reservation messages from Host Platform. This step is crucial for establishing a connection between your application and Host Platforms webhook feature.

Incoming Messages

Process: When an event is triggered, Host Platform sends a HTTP POST request to your systems Webhook API. This request includes the reservation details and recipient detials.

Key Benefits

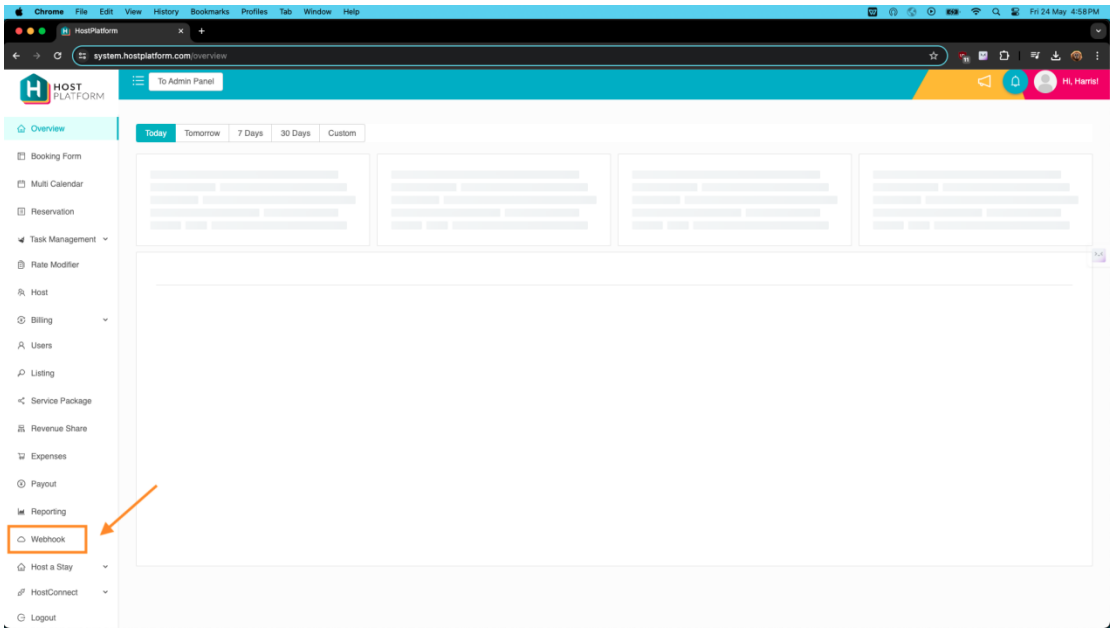
1. **Real-Time Communication:** Webhooks provide instantaneous message delivery, significantly enhancing user engagement.

2. **Automation:** Streamline your messaging process by automating both sending and responses, which reduces manual effort.

3. **Tracking:** Keep a comprehensive record of all webhook API calls to monitor message statuses effectively.

1. Login Instruction

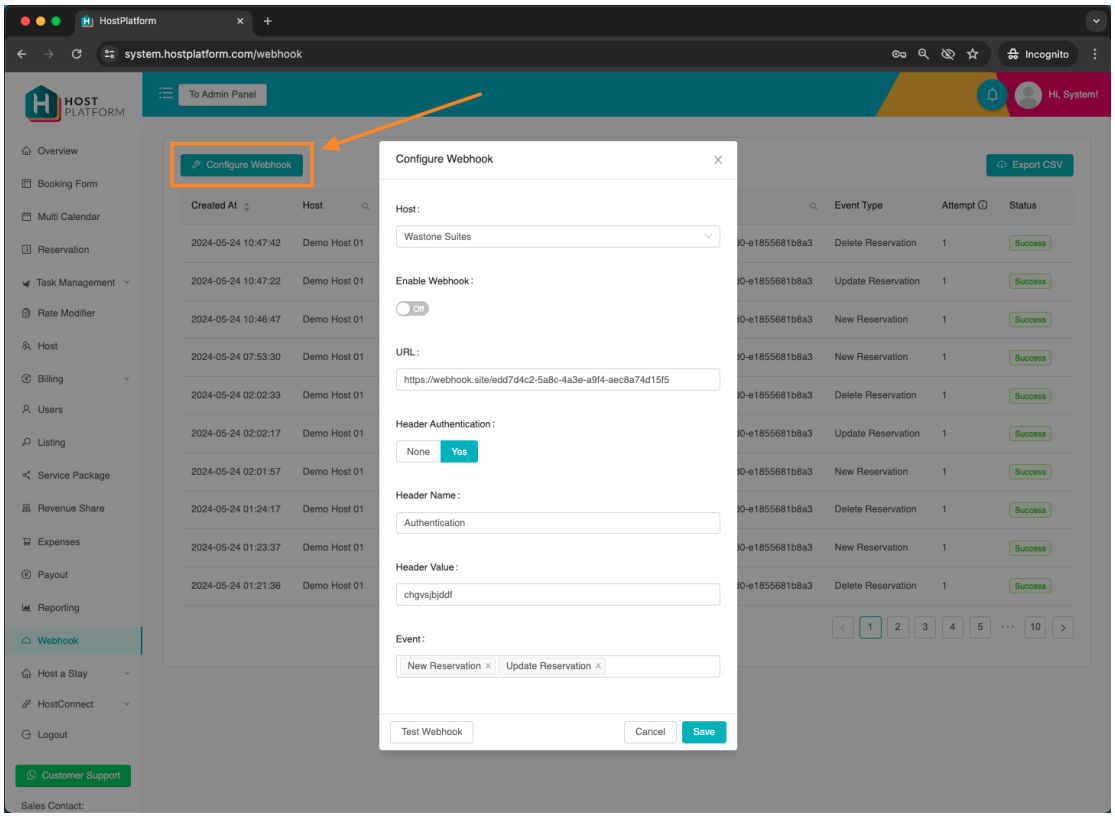
Login into HostPlatform system via url :
https://system.hostplatform.com/



Upon logging in, the webhook tab will be present at navigation bar on the left. This webhook tab will only be visible to hosts.

2. Webhook Configuration

To configure your webhook, click the button on the top left and a configuration window will pop up.



Host: User can select which host they want the webhook to be configured to. All actions set will be updated to that host.

Enable: Toggle “On” to enable webhook. If set to “Off”, no webhook will be sent to configured host.

URL: The URL that your webhook will be sent to.

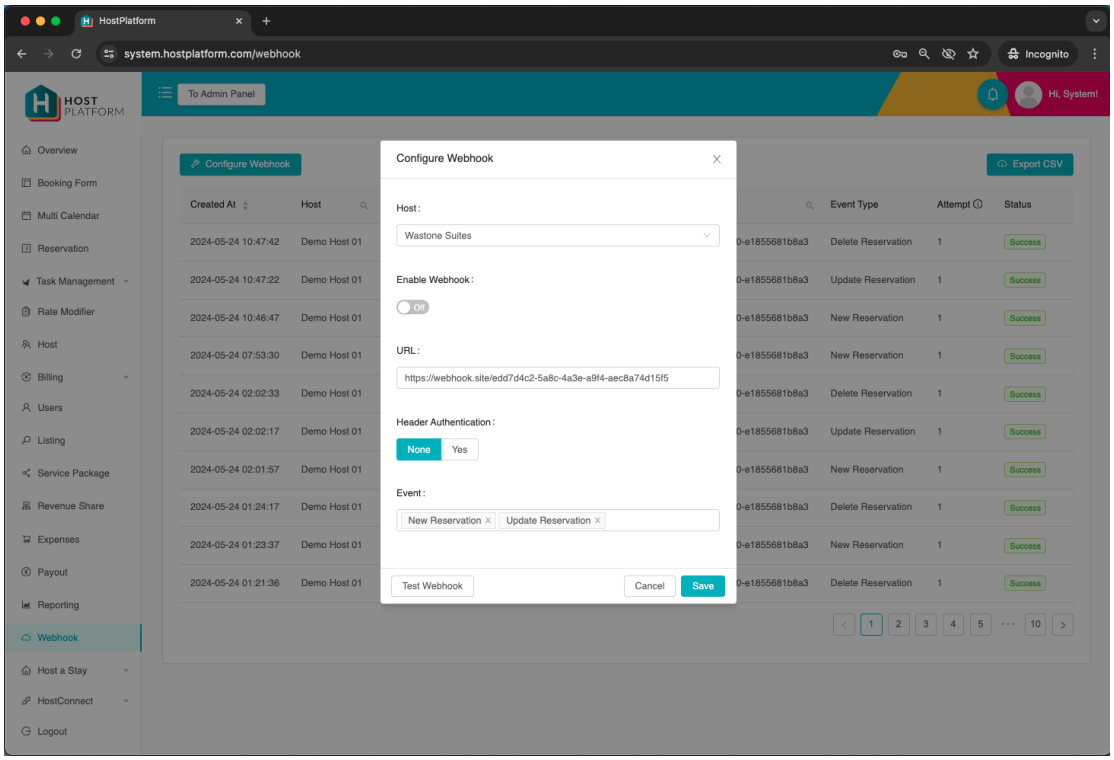
Header Authentication: Click “Yes” to set your authentication header name and value.

Event: Select which event you’d want to trigger your webhook function.

2.1 Header Authentication

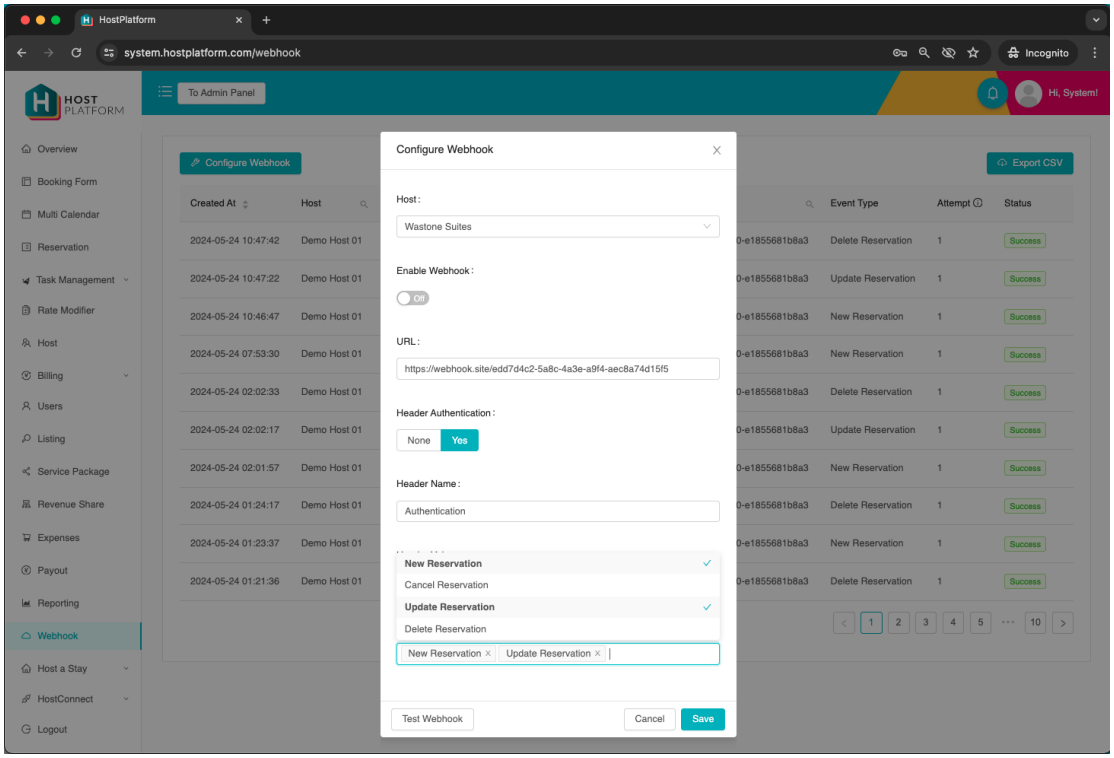
The header authentication can be treated as a “username” and “password” which allows the host to authorised Host Platform to send them webhooks.

If user switches header authentication to “None”, the text box will be removed. User can switch it back to “Yes” to re-configure their header authentication.



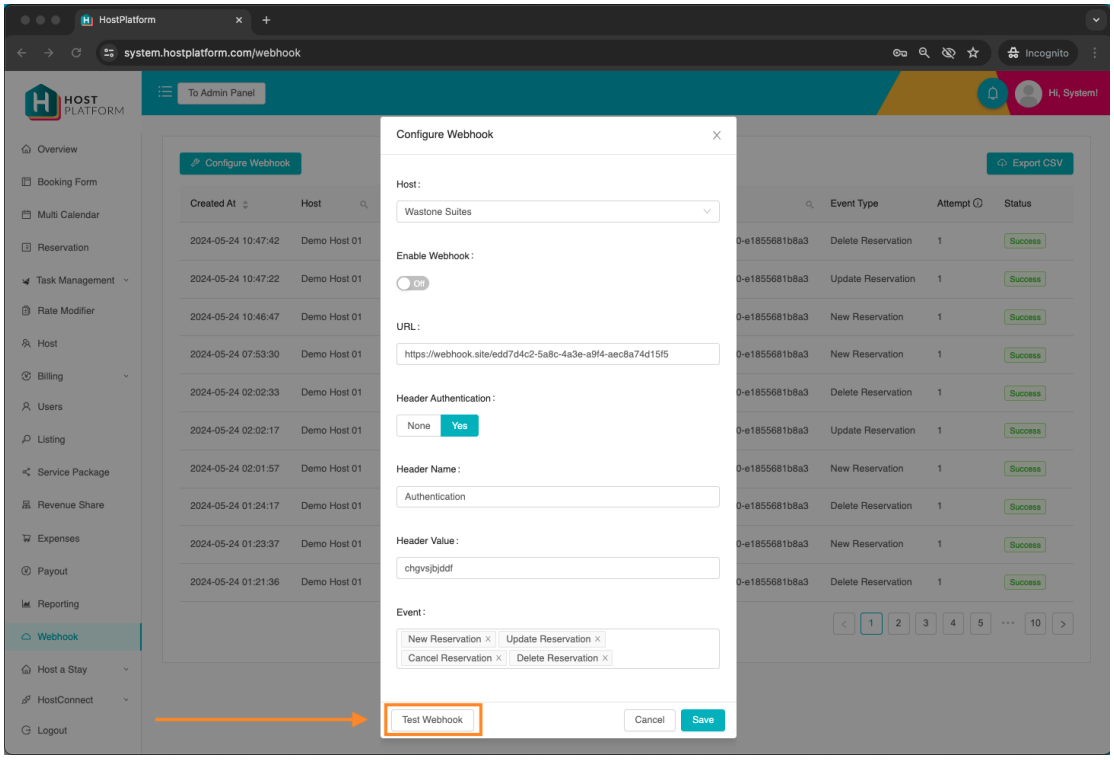
2.2 Event

Currently there's 5 events for users to configure, create, update (all), update (contact only), cancel and delete reservation with at least 1 event must be selected.



Example: If user have create reservation event configured, everytime a reservation is created, a webhook will be sent to the configured URL.

2.3 Testing webhooks: Click “Test Webhook” buttton after configuration has been complete.



System will use the configuration along with a dummy reservation payload and send it to the URL endpoint. The event for test webhook will always be treated as creating new reservation.

User will receive a success or fail message depending on the result. Test webhook will not appear in the webhook logs.

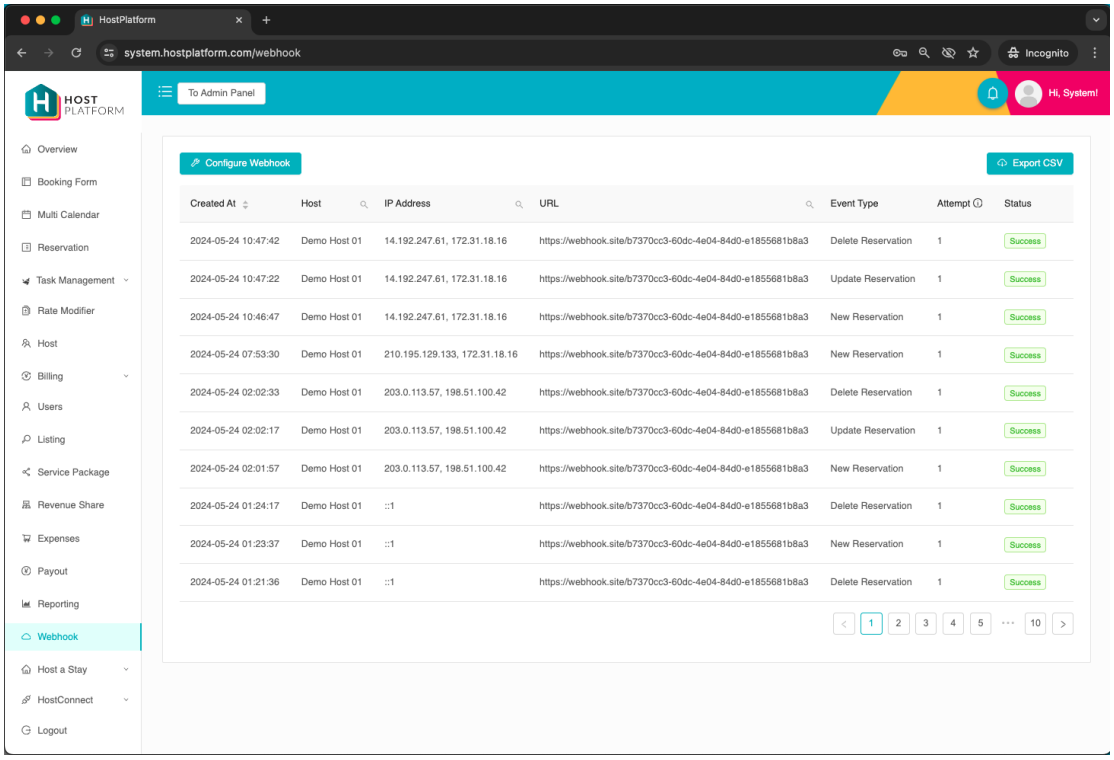
3. Sending Webhooks

When the reservation events are triggered (create, update (all), update (contact only), cancel, delete), system will package the reservation and send it to the intended host.

The payload includes:
- Header name and key
- URL
- The event type (create, update (all), update (contact only), cancel, delete)
- Host name and ID

To verify if your webhooks have been sent successfully, you can head to the webhook logs to view the records.

4. Webhook Logs

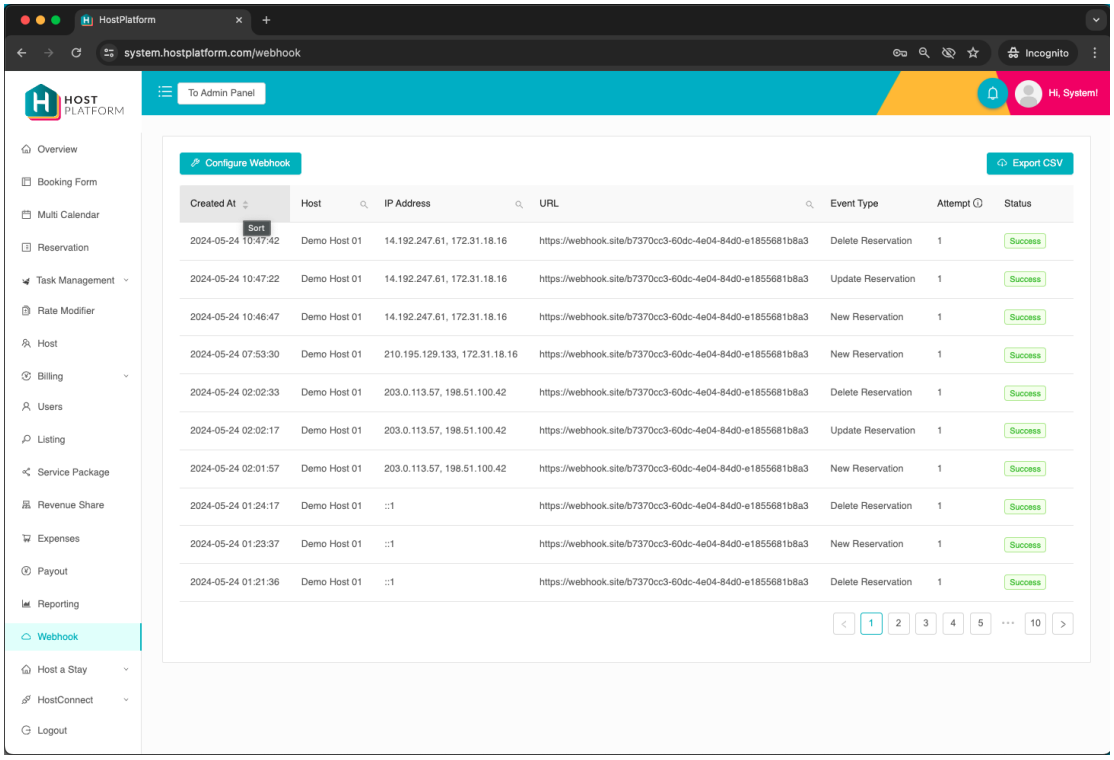


Log Overview: The system maintains a detailed log of all webhook activities, including the triggered events, status, and number of attempts.

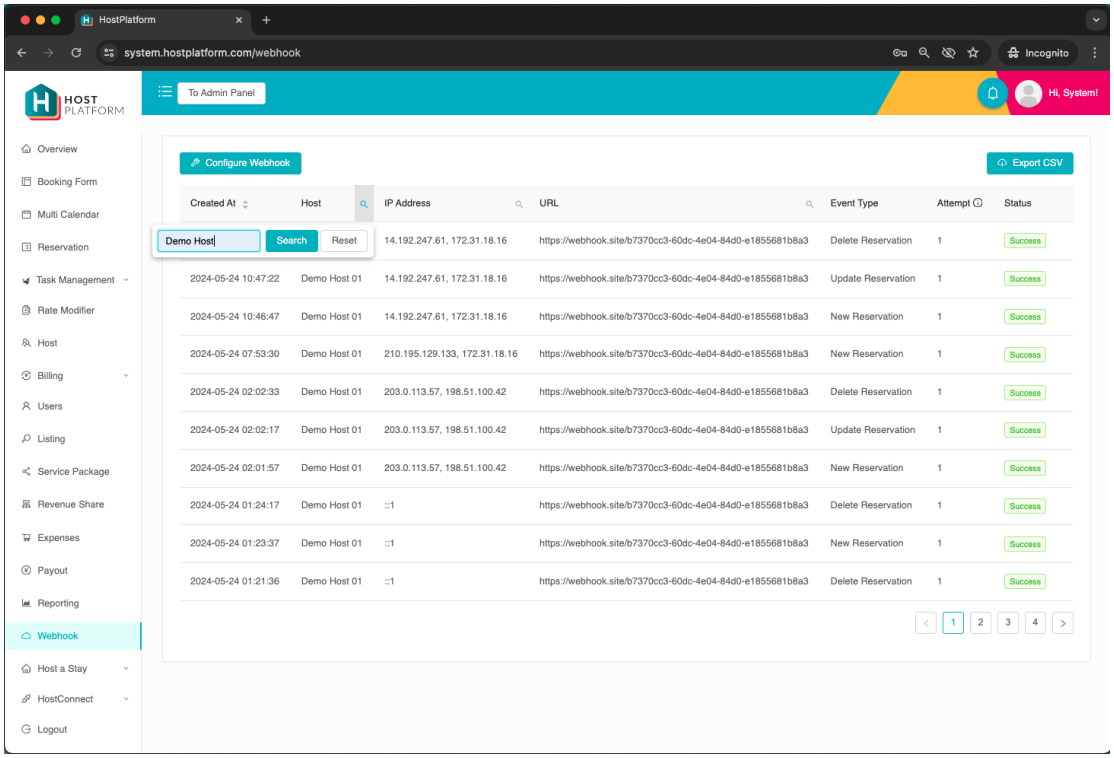
Accessing Logs: Navigate to the “Webhook” tab on the left navigation bar. You can filter logs by date, host, or ip address for easier analysis.

Error Handling: In the event of errors, the system re-sends failed webhooks to the configured URL every 30 mins.

4.1 Sort Function: Logs with up/down arrows are able to be sorted in ascending/decending order

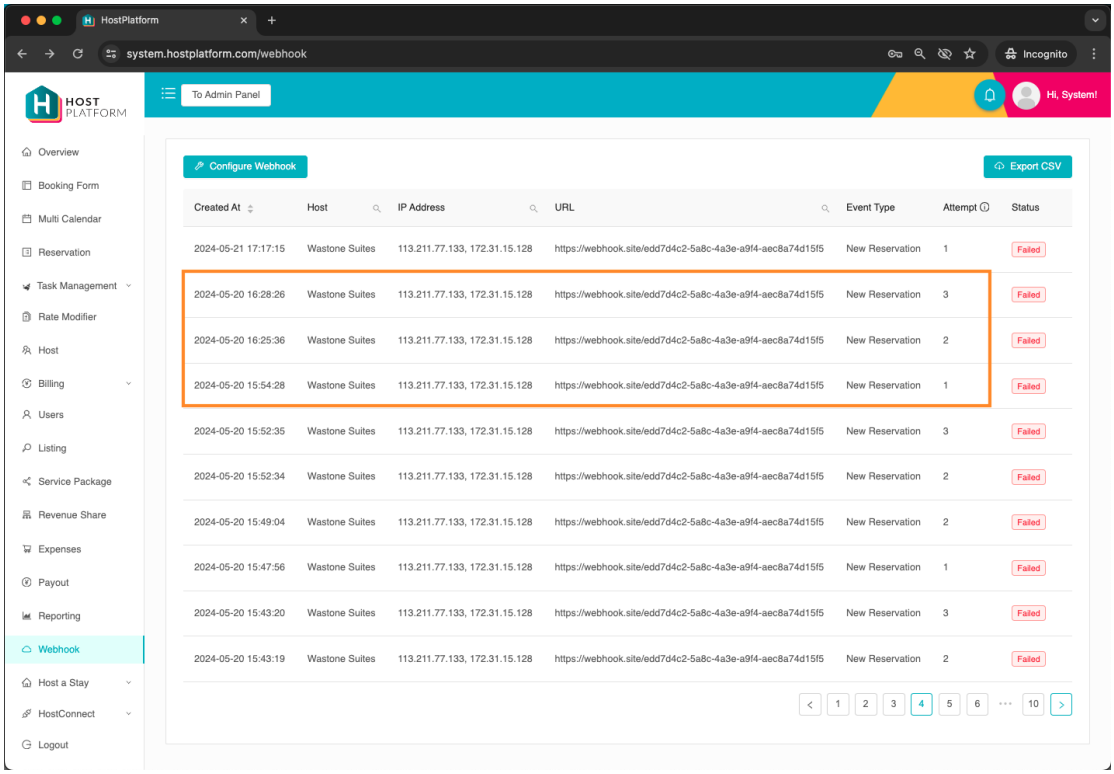


4.2 Search Function: Click the magnifier icon to expand the search features. Enter the key word into the input and search for relevant logs.



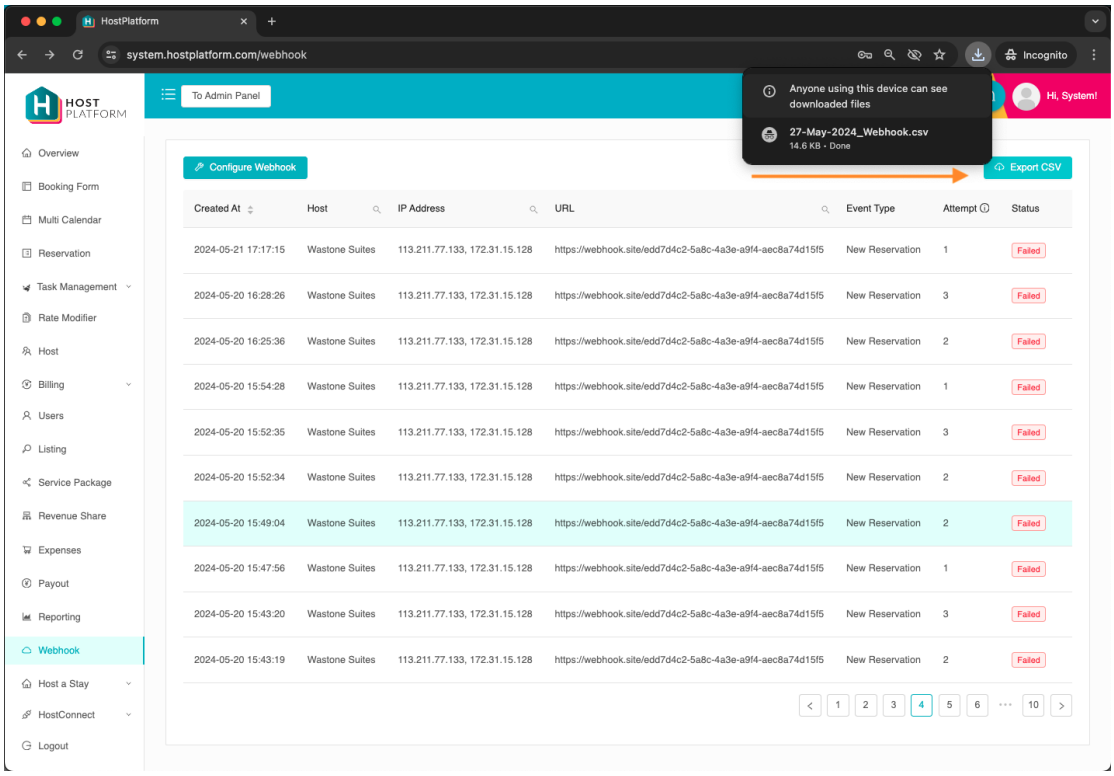
4.3 Webhook retry:

The system will re-send failed webhooks every 30 minutes up to a maximum of 5 attempts. When the initial webhook is sent, it is considered the 1st attempt.



The retry will create a new log with the number of attempts increased by 1.

4.4 Export logs in CSV format: Click the “Export CSV” button on the top right corner.



4.4.1 CSV Format

	A	B	C	D	E	F	G
